

JTFA—A New Perspective on Signal Analysis

Starting at
\$495

The curved line in the "Time-Frequency Representation" above depicts a radio signal received by the DOE Alexis Satellite. This radio signature is typical of many scientific signals that are hidden by man-made carrier interference and natural noise, which are seen as horizontal lines and periodic marks. JTFA is the best way to identify these signals, because neither the Time Series nor the Power Spectrum reveals the presence of the signal curve seen in the JTFA plot. Screen courtesy of Los Alamos National Laboratory, Group NIS-1.

The National Instruments JTFA (Joint Time-Frequency Analysis) Toolkit is a comprehensive time-frequency analysis software package. The package features many popular algorithms, including two unique algorithms developed by scientists at National Instruments. These algorithms include:

- Adaptive Spectrogram (also known as "Matching pursuit")
- Choi-Williams Distribution
- Cone-Shaped Distribution
- Gabor Spectrogram
- Short-Time Fourier Transform (spectrogram)
- Wigner-Ville Distribution

The JTFA Toolkit runs stand alone on Windows, Windows NT, Mac OS, HP-UX and Sun Solaris. In addition, with dynamic signal acquisition hardware and LabVIEW® software from

National Instruments, you can easily customize the JTFA Toolkit for your own application.
